

Already Thinking about Catch Crop Application Today

In order to increase the variety in cultivation, catch crop seeding between the main crops is highly recommended. In avoidance of crop rotation diseases, you have to choose mixtures WITHOUT seeds of the same plant family than the main crops. Ideally, these catch crops are seeded during tillage, so the seeds can be worked in the soil.

For this application, the Pneumatic Seeder from APV is best suitable and definitely the best choice. Depending on the customer's requirements and needs, the seeders are available with hopper capacities from 120 to 1.600 litres.

In addition to the seeding of catch crops, APV seeders can apply nurse crops and grass reseeding. It is also possible to spread fertilisers with the fertiliser edition of APV. For this purpose, the products have a non-corrosive coating and stainless steel parts.
