

With APV Snow and Ice Removal Spreader through the Winter

The winter service implements of APV are best suited for private use as well as for professionals. With its capacity of 40 litres, the WD40 M2 is often used for smaller applications. With its electrical driven spreader disc, the spreading width can be adapted from 1 to 5 m while driving through.

The latest invention of APV's winter service spreaders is the Universal Dispenser UDW100 M1 and UDW250 M1. They have a metering unit made of stainless steel. Their exact metering by means of a seeding shaft appoints them as reliable partners in the winter months. Due to the electronical adjustment of the spreader, it is possible to regulate the working width as well as the seeding rate while sitting on the driver's seat.

Your advantages:

- Dosing unit made of stainless steel including a seeding shaft for exact metering – up to 20 kg salt per minute
- Plastic hopper has 105 or 250 litres
- Working width adaptable from 1 to 6 m
- Spreading salt, fine-grained split or mixtures of both (possible without alteration!!)
- You can choose out of two Control Boxes: Control Box 5.2 (combination with speed sensors, etc. is possible) or Control Box 1.2
- Mounting option on every 12V-driven vehicle
- Exact metering of small and big amounts with the "Flex"-Seeding shaft with 80 mm in diameter
- Chain-propelled agitator
- Simple calibration test (while motors are not in motion and the spreader disc is turned down)
- Spreading of corrosive granulates (fertilizer) is possible
